

1 数论初步

1.1

证明.

(1)

$$\forall x|a, x|b \begin{cases} x > 0 & \xrightarrow{a>0, x|a} x \leq a \\ x < 0 & \xrightarrow{a>0} x < a \end{cases} \Rightarrow x < a \xrightarrow{a|a, a|b} (a, b) = a.$$

(2)

$$\left\{ \begin{array}{l} (a, b)|(a, b), (a, b)|b \\ \forall x|(a, b), x|b, \text{ 有 } x \leq (a, b). \text{ (证明同(1))} \end{array} \right. \Rightarrow ((a, b), b) = (a, b).$$

□

1.2

证明.

(1) 不妨假设 $\exists n > 0, (n, n+1) = d > 1$

$$\begin{aligned} (n, n+1) = d &\Rightarrow \exists x, y \in \mathbb{Z}, n = xd, n+1 = yd \\ &\Rightarrow 1 = (n+1) - n = (y-x)d > 0 \\ &\Rightarrow y > x, (y-x)d \geq d > 1 \\ &\Rightarrow \text{矛盾, 假设不成立.} \end{aligned}$$

(2) 可取 (n, k) , 证明如下

由推论 2.3, 取 $x = 1, a = n, b = k$, 有 $(n, k) = (n, n+k)$.

□

1.3

(1) $(314, 159) = 1$, 有解。由辗转相除法

$$314 = 159 \cdot 1 + 155$$

$$159 = 155 \cdot 1 + 4$$

$$155 = 4 \cdot 38 + 3$$

$$4 = 3 \cdot 1 + 1$$

即

$$1 = 4 - 3 \cdot 1$$

$$= 4 - (155 - 4 \cdot 38) \cdot 1$$

$$= (159 - 155 \cdot 1) \cdot 39 - 155$$

$$= 159 \cdot 39 - 155 \cdot 40$$

$$= 159 \cdot 39 - (314 - 159 \cdot 1) \cdot 40$$

$$= 159 \cdot 79 - 314 \cdot 40.$$

即 $x = -40, y = 79$.

(2) $(3141, 1592) = 1$, 有解。由辗转相除法

$$3141 = 1592 \cdot 1 + 1549$$

$$1592 = 1549 \cdot 1 + 43$$

$$1549 = 43 \cdot 36 + 1$$

即

$$1 = 1549 - 43 \cdot 36$$

$$= 1549 - (1592 - 1549 \cdot 1) \cdot 36$$

$$= 1549 \cdot 37 - 1592 \cdot 36$$

$$= (3141 - 1592 \cdot 1) \cdot 37 - 1592 \cdot 36$$

$$= 3141 \cdot 37 - 1592 \cdot 73.$$

即 $x = 37, y = -73$.

1.4

证明.

$$(0) \quad n = 1, n^3 - n = 0, \text{ 有 } 0 = 6 \cdot 0, 6|(n^3 - n).$$

$$(1) \quad n = 2, n^3 - n = 0, \text{ 有 } 6 = 6 \cdot 1, 6|(n^3 - n).$$

$$(2) \quad \text{假设 } n = k, k \in \mathbb{N} \text{ 时, 有 } 6|(k^3 - k), \text{ 则 } n = k + 1 \text{ 时有}$$

$$\begin{aligned} (k+1)^3 - (k+1) &= k^3 + 3k^2 + 2k \\ &= (k^3 - k) + 3k(k+1) \end{aligned}$$

显然有 $6|(k^3 - k)$, 下证 $6|3k(k+1)$

$$1^\circ \quad k = 1, 3k(k+1) = 6, \text{ 有 } 6 = 6 \cdot 1, 6|3k(k+1)$$

$$2^\circ \quad \text{若 } 6|3k(k+1), \text{ 则}$$

$$3(k+1)(k+2) = 3k(k+1) + 6(k+1) \Rightarrow 6|3(k+1)(k+2)$$

即证

$$\forall k \in \mathbb{N} \quad 6|3k(k+1) \Rightarrow 6|(k+1)^3 - (k+1)$$

综上, 即证

$$\forall n > 0, \quad 6|(n^3 - n).$$

□

1.5

证明.

$$\left\{ \begin{array}{ll} 3^4 \equiv 1(\text{mod } 10) & \Rightarrow 3^{4n} \equiv 1(\text{mod } 10) \\ & \Rightarrow 3^{m+4n} \equiv (-1)(\text{mod } 10). \\ 10|(3^m + 1) & \Rightarrow 3^m \equiv (-1)(\text{mod } 10) \end{array} \right.$$

即证

$$10|(3^{m+4n} + 1)$$

□

1.6

(1)

$$2345 = 5 \cdot 7 \cdot 67$$

(2)

$$3456 = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 3 \cdot 3 \cdot 3$$

1.7

证明. 不妨假设 $\exists n > 0$, 使得 $n(n+1) = d^2$ 为平方数, 则有

$$n^2 < n(n+1) = d^2 < (n+1)^2 \Rightarrow n < d < n+1$$

不存在相邻整数间的整数, d 不存在, 假设不成立, 即证. □

1.8

证明. $n = 5! + 1 = 2 \cdot 3 \cdot 4 \cdot 5 + 1$.

(1)

$$n+1 = 2 \cdot 3 \cdot 4 \cdot 5 + 2 = 2 \cdot (3 \cdot 4 \cdot 5 + 1)$$

(2)

$$n+2 = 2 \cdot 3 \cdot 4 \cdot 5 + 3 = 3 \cdot (2 \cdot 4 \cdot 5 + 1)$$

(3)

$$n+3 = 2 \cdot 3 \cdot 4 \cdot 5 + 4 = 4 \cdot (2 \cdot 3 \cdot 5 + 1)$$

(4)

$$n+4 = 2 \cdot 3 \cdot 4 \cdot 5 + 5 = 5 \cdot (2 \cdot 3 \cdot 4 + 1)$$

□

1.9

(1) $(1, 1) = 1|2$, 方程有解, $x_0 = 0, y_0 = 2$ 为一组特解, 故通解为

$$\begin{cases} x = t & (t \in \mathbb{Z}) \\ y = 2 - t \end{cases}$$

(2) $(2, 1) = 1|2$, 方程有解, $x_0 = 0, y_0 = 2$ 为一组特解, 故通解为

$$\begin{cases} x = t & (t \in \mathbb{Z}) \\ y = 2 - 2t \end{cases}$$

(3) $(15, 16) = 1|17$, 方程有解, $x_0 = -17, y_0 = 17$ 为一组特解, 故通解为

$$\begin{cases} x = 16t - 17 & (t \in \mathbb{Z}) \\ y = 17 - 15t \end{cases}$$

1.10

(1) $(6, -15) = 3|51$, 方程有解, $x_0 = 11, y_0 = 1$ 为一组特解, 故通解为

$$\begin{cases} x = 11 - 5t & (t \in \mathbb{Z}) \\ y = 1 - 2t \end{cases}$$

又要求负整数解, 故 $x, y < 0, t \geq 3$, 即所以负整数解为

$$\begin{cases} x = 11 - 5t & (t \in \mathbb{Z}, t \geq 3) \\ y = 1 - 2t \end{cases}$$

(2) $(6, 15) = 3|51$, 方程有解, $x_0 = 6, y_0 = 1$ 为一组特解, 故通解为

$$\begin{cases} x = 6 + 5t & (t \in \mathbb{Z}) \\ y = 1 - 2t \end{cases}$$

又要求负整数解, 故 $x, y < 0, t$ 无解, 即无负整数解.

1.11

设需要 x 张 5 分, y 张 1 角, $z = (30 - x - y)$ 张 2 角五分. 有

$$\begin{aligned} 0.05x + 0.1y + 0.25(30 - x - y) &= 5 \Leftrightarrow x + 2y + 5(30 - x - y) = 100 \\ &\Leftrightarrow 4x + 3y = 50 \end{aligned}$$

$(4, 3) = 1|50$, 方程有解, $x_0 = 2, y_0 = 14$ 为一组特解, 故通解为

$$\begin{cases} x = 2 + 3t & (t \in \mathbb{Z}) \\ y = 14 - 4t \end{cases}$$

又 $x, y, z \in \mathbb{N}$, 即

$$\begin{cases} 2 + 3t \geq 0 \\ 14 - 4t \geq 0 \\ 14 + t \geq 0 \end{cases} \xrightarrow{t \in \mathbb{Z}} t = 0, 1, 2, 3.$$

即有 4 种方案, 记 x 张 5 分, y 张 1 角, z 张 2 角五分, 则方案为

$$\begin{cases} x = 2 \\ y = 14 \\ z = 14 \end{cases} \quad \begin{cases} x = 5 \\ y = 10 \\ z = 15 \end{cases} \quad \begin{cases} x = 8 \\ y = 6 \\ z = 16 \end{cases} \quad \begin{cases} x = 11 \\ y = 2 \\ z = 17 \end{cases}$$

1.12

设买了 x 个苹果, $12 - x$ 个橘子, 每个苹果 y 分钱, 每个橘子 $y - 3$ 分钱, 则有

$$\begin{cases} 0 \geq 12 - x < x \\ xy + (12 - x)(y - 3) = 99 \end{cases} \Leftrightarrow \begin{cases} 6 < x \leq 12 \\ x + 4y = 45 \end{cases}$$

$(1, 4) = 1|45$, 方程有解, $x_0 = 9, y_0 = 9$ 为一组特解, 故通解为

$$\begin{cases} x = 9 + 4t & (t \in \mathbb{Z}) \\ y = 9 - t \end{cases}$$

又 $6 < x \leq 12$, 即 $t = 0, x = 9, 12 - x = 3$, 买了 9 个苹果和 3 个橘子.

1.13

$$6k + 5 \equiv 6k + 1 \pmod{4}$$

又 $6k \equiv 6 \pmod{4}$, 有

$$\begin{aligned} 6k + 5 &\equiv 7 \pmod{4} \\ &\equiv 3 \pmod{4} \end{aligned}$$

1.14

证明.

(1) 分情况讨论 $6k, 6k+2, 6k+3, 6k+4$ ($k \geq 1$) 即可, 不再赘述.

(2) 记素数为 $p, p > 3$.

(a) $p < 6$, 则 $p = 5$, 成立.

(b) $p > 6$, 有 $(6, p) = 1$, 故 p 属于 6 的缩系, 故 p 模 6 或与 1 或 5 同余.

□

1.15

证明.

不妨设这两个连续的立方数为 k^3 与 $(k+1)^3$.

$$\begin{aligned}(k+1)^3 - k^3 &\equiv 3k^2 + 3k + 1 \pmod{3} \\ &\equiv 1 \pmod{3}\end{aligned}$$

□

1.16

证明.

设该数为 $A = \overline{a_n a_{n-1} \dots a_1 a_0}$, 则

$$A = \sum_{i=0}^{i=n} a_i \cdot 10^i, \quad \sum_{i=0}^{i=n} a_i \equiv 0 \pmod{3}$$

又 $\forall k \in \mathbb{N}, 10^i \equiv 1 \pmod{3}$, 故

$$\begin{aligned}A &\equiv \sum_{i=0}^{i=n} a_i \cdot 10^i \pmod{3} \\ &\equiv \sum_{i=0}^{i=n} a_i \pmod{3} \\ &\equiv 0 \pmod{3}\end{aligned}$$

□

1.17

证明.

(1)

$$10 \equiv -1(\text{mod}11) \Rightarrow 10^k \equiv (-1)^k(\text{mod}11)$$

(2) 设数为 $A = \overline{a_n a_{n-1} \dots a_1 a_0}$, 则

$$A \equiv 0(\text{mod}11) \Leftrightarrow \sum_{i=0}^n (-1)^i \cdot a_i \equiv 0(\text{mod}11)$$

即偶数位之和与奇数位之和的差能被 11 整除等价于该数也能被 11 整除.

□

1.18

(1)

$$\begin{aligned} 2x &\equiv 1(\text{mod}17) \\ &\xrightarrow{(2,17)=1} x \equiv 9(\text{mod}17) \\ &\equiv 18(\text{mod}17) \end{aligned}$$

(2) $(3, 18) = 3|6$, 故有 3 组解由 $x \equiv 2(\text{mod}6)$ 得原方程解为

$$x \equiv 2 + 6t(\text{mod}18) \quad (0 \leq t \leq 2).$$

即

$$x \equiv 2, 8, 14(\text{mod}18).$$

(3) $(4, 18) = 2|6$, 故有 2 组解解 $2x \equiv 3(\text{mod}9)$

$$\begin{aligned} 2x &\equiv 3(\text{mod}9) \\ &\xrightarrow{(2,9)=1} x \equiv 6(\text{mod}9). \\ &\equiv 12(\text{mod}9) \end{aligned}$$

即原方程解为

$$x \equiv 6 + 9t(\text{mod}18) \quad (t = 0, 1) \Rightarrow x \equiv 6, 15(\text{mod}18).$$

(4)

$$\begin{aligned} 3x &\equiv 1(\text{mod}17) \\ &\xrightarrow{(3,17)=1} x \equiv 6(\text{mod}17). \\ &\equiv 18(\text{mod}17) \end{aligned}$$
